

SURVEILLANCE REPORT

Influenza virus characterisation

Summary Europe, November 2012

Summary

During the 2011/2012 season, A(H1N1)pdm09, A(H3N2) and B/Victoria and B/Yamagata lineage influenza viruses, with collection dates between 1 January and 30 September 2012 (weeks 1–39), have been detected in ECDC-affiliated countries.

- Type A viruses predominated over type B.
- A(H3N2) viruses predominated over A(H1N1)pdm09 viruses.
- A(H1N1)pdm09 viruses continued to show genetic drift from the vaccine virus, A/California/07/2009, but the vast majority remained antigenically similar to it.
- Antigenic drift of A(H3N2) viruses compared to the A/Perth/16/2209 vaccine virus resulted in a recommendation to change to an A/Victoria/361/2011-like component for the 2012/2013 influenza season.
- B/Victoria lineage viruses fell within the B/Brisbane/60/2008 genetic clade and were antigenically similar to reference cell-propagated viruses of the B/Brisbane/60/2008 genetic clade.
- Recent B/Yamagata-lineage viruses fell into two genetic clades in approximately equal proportions: clade 3 represented by the recommended vaccine component for the 2012/2013 influenza season, B/Wisconsin/1/2010, and clade 2 represented by B/Estonia/55669/2012. Viruses in each clade are antigenically distinguishable.

A summary table of viruses received from EU and EEA countries by the MRC National Institute for Medical Research WHO Collaborating Centre for Reference and Research on Influenza and collected between 1 January and 30 September 2012 is shown in Table 1.

Viruses and/or clinical samples have been received from 21 EU/EEA countries. The majority (68%) of viruses received have been influenza A(H3N2) viruses. Among the influenza B viruses received, those of the B/Yamagata and B/Victoria lineages were received in approximately equal proportions. Influenza A(H1N1)pdm09 viruses were received in low numbers and from only eight countries, with Norway providing nearly 50% (18/39). Table 1 is an update of the one in the previous <u>report</u> (October 2012). The two new A(H1N1)pdm09 viruses in the table both came from the Netherlands and were collected in August.

1. Propagated to sufficient titre to perform HI assay 2. Propagated to sufficient titre to perform HI assay in presence of 20 nM oseitamivir 3. Package received 2012-05-10

Influenza A(H1N1)pdm09 virus analyses

The results of an HI assay carried out to examine the two oseltamivir-resistant A(H1N1)pdm09 viruses received from the <u>Netherlands</u> since the <u>October report</u> are shown in Table 2. A/Netherlands/492/2012 showed good reactivity with post-infection ferret antisera raised against the panel of reference viruses, including antiserum raised against the vaccine virus. A/California/7/2009. A/Netherlands/507/2012 showed at least four-fold reduced reactivity with eight of nine antisera in the panel, including that raised against the vaccine strain. Sequence analysis of the HA gene of A/Netherlands/507/2012 revealed an amino acid polymorphism at position N156D>N in the glycoprotein, which has previously been associated with low reactivity in HI assays and commonly results from propagation of viruses in certain tissue culture cells. Phylogenetic analysis of the HA gene of representative viruses (Figure 1) shows that the most recently detected H1N1 viruses from EU/EEA countries cluster within Groups 6 and 7, as previously described. Both Netherlands viruses fall within Group 6.

Table 2 Antigenic analysis of A(H1N1)pdm09 viruses by HI

Influenza A(H3N2) virus analyses

No new HI assays on influenza A(H3N2) viruses have been carried out since the <u>previous report</u> which gave results for A/Norway/1422/2012 and A/Norway/1443/2012.

Phylogenetic analysis of the HA gene sequences of representative viruses has been carried out (Figure 2). Viruses from the EU/EEA collected since January have HA genes that fall into the A/Victoria/208 clade, genetic groups 5 and 6, and subgroups 3A, 3B and 3C.

The HA1 amino acid substitutions that are associated with each of these groupings are:

- Subgroup 3A: V223I, N144D (resulting in the loss of a glycosylation site) and N145S, e.g. A/Stockholm/18/2011;
- Subgroup 3B: V223I, N145S, A198S & N312S, e.g. A/Athens/GR112/2012;
- Subgroup 3C: V223I, S45N, T48I, A198S & N312S, e.g. the prototype vaccine virus A/Victoria/361/2011, with some viruses also carrying the substitutions Q33R and N278K (e.g. A/Berlin/93/2011);
- Group 5: D53N, Y94H, I230V and E280A, e.g. A/Alabama/5/2010 and A/Norway/1443/2012;
- Group 6: D53N, Y94H, S199A, I230V and E280A, e.g. A/Iowa/19/2010 and A/Norway/1422/2012.

Influenza B virus analyses

B/Victoria-lineage virus

No new HI assays on influenza B (Victoria-lineage) viruses have been carried out since the <u>previous report</u> which gave results for B/Norway/1477/2012.

Phylogenetic analysis of the HA genes of representative B/Victoria lineage viruses is shown in Figure 3. All recently collected viruses received from EU and EEA laboratories carried HA genes that fell into clade 1, the B/Brisbane/60 clade, inclusive of B/Norway/1477/2012.

B/Yamagata-lineage viruses

No new HI assays on influenza B (Yamagata-lineage) viruses have been carried out since the <u>previous report</u> which gave results for B/Norway/1494/2012, B/Norway/1836/2012 and B/Norway/1864/2012.

Figure 4 shows a phylogenetic analysis of the HA genes of representative B/Yamagata lineage viruses. The HA genes of these viruses fall into two genetic clades, one defined as clade 3, represented by the vaccine virus B/Wisconsin/1/2010 and reference viruses B/Bangladesh/3333/2007 and B/Stockholm/12/2011, with the other defined as clade 2 and represented by the reference viruses B/Brisbane/3/2007 and B/Estonia/55669/2011. Viruses falling within these two clades are antigenically distinguishable.

The two clades are differentiated by substitutions at HA1 residues 48, 108, 150, 165, 181 and 229. The HA genes of viruses in clade 2 encode K48, A108, S150, N165, A181 and G229. The HA genes of viruses in clade 3 encode R48, P108, I150, Y165, T181 and D229.

Clade 2 appears to be genetically homogenous and contains viruses B/Norway/1494/2012 and B/Norway/1836/2012, but clade 3 can be sub-divided into four genetic groups:

- a group defined by the amino acid substitution N202S similar to B/Wisconsin/1/2010;
- a group defined by the substitution T181K (e.g. B/Ireland/M1522/2012);
- a group defined by the substitution M251V with the substitutions T181A and K253R (e.g. B/Serbia/1894/2011);
- a group defined by the substitution M251V with the substitutions V29A and L172Q (e.g. B/Stockholm/12/2011), often with N123T (e.g. B/Norway/1864/2012).

Influenza A(H3N2)v virus

As noted <u>previously</u>, on 3 August 2012 the United States Centers for Disease Control issued a <u>Health Advisory</u> describing an increase in the number of influenza A(H3N2)v infections in three US States and CDC have prepared further <u>background information</u> and have provided <u>updated</u> case counts. As of 1 December 2012 there were 308 confirmed cases. Antigenic and genetic characterisation of H3N2v viruses has been described by <u>Lindstrom et al., 2012</u>. The virus was characterised as being antigenically distinct from currently circulating human seasonal influenza viruses and to be a reassortant virus with seven genes from swine influenza 'triple reassortant' H3N2 viruses and the M-gene from an influenza A(H1N1)pdm09 virus.

Risk assessments for these A(H3N2)v viruses, as a risk to public health, have been posted by the <u>United States</u> <u>CDC</u> and <u>ECDC</u>.

A description of results generated by the WHO Collaborating Centre for Reference and Research on Influenza, based at the MRC National Institute for Medical Research in London, and evaluated at the WHO Vaccine Composition Meetings held at WHO Geneva on 20–22 February 2012 and Beijing, China on 17–19 September 2012 can be found at:

http://www.nimr.mrc.ac.uk/documents/about/interim-report-feb-2012.pdf and http://www.nimr.mrc.ac.uk/documents/about/Interim Report September 2012 2.pdf

Note on the figures

The phylogenetic trees were constructed using RAxML and drawn using FigTree. The bars indicate the proportion of nucleotide changes in the sequence. Reference strains are viruses to which post-infection ferret antisera have been raised. The colours indicate the month of sample collection. Isolates from WHO National Influenza Centres (NICs) in ECDC-affiliated countries are highlighted in boxes. Sequences for some of the viruses from non-EU/EEA countries were recovered from GISAID (Global Initiative on Sharing All Influenza Data) and we acknowledge all laboratories who submitted sequences directly to the London WHO CC.
